

Digital Compass

Intention vs. Reality + Digital Escape Map

A generative AI tool that helps users understand why they open their phone and where their attention actually goes.

Current prototype presentation

The Problem

Screen time alone does not explain digital drift.

- 1** Users often open their phones with a clear, harmless intention.
- 2** During use, attention can drift into social media or short-form video.
- 3** Traditional screen-time tools show duration, not the context or cause of the drift.

The problem is not only “too much time.” It is the invisible gap between the user’s original intention and actual behavior.

How Digital Compass Works

The core product flow is simple and demo-friendly.

01

Intention

Why did I open my phone?

02

Actual Behavior

What actually happened?

03

Pattern

What keeps repeating?

04

Insight

What should I notice?

05

Small Experiment

What can I try next?

The output is not a generic warning. It is a personalized reflection tied to the user's own records.

Current Prototype

The GitHub version demonstrates the main user journey.

Prototype focus: record an intention, compare it with real behavior, and reveal repeated digital escape paths.

AI Role

AI is used for meaning, not decoration.

1 Semantic comparison

Compares the user's intention and actual behavior beyond simple time difference.

2 Pattern analysis

Reviews recent records to identify repeated contexts, triggers, and escape routes.

3 Personalized experiment

Generates one small, realistic behavior experiment based on the detected pattern.

Without AI, the system can only store records. With AI, those records become explainable, cautious, and actionable insight.

Prompt Design & Safety

The model is constrained to produce useful and responsible outputs.

Structured output

The backend requests a fixed JSON result: drift level, possible triggers, recurring patterns, insight, experiment, and safety note.

Safety rules

The prompt forbids diagnosis, addiction labels, personality claims, and certainty from limited data.

Fallback behavior

If the API fails, a deterministic local fallback keeps the demo working without pretending to be AI.

Demo Scenario

One realistic record shows the full loop.

User record

Intention	Reply to a message
Planned	5 min
Before	Studying, overwhelmed
Actual	Replied, then watched Reels
Actual time	52 min

Record Analysis

One session becomes meaningful when compared with recent records.

User record

Intention	Reply to a message
Planned time	5 min
Before	I was studying and felt overwhelmed
Actual use	Replied, then watched Instagram Reels
Actual time	38 min

System output

Intention drift
High
Possible trigger
Study break and mental fatigue
Recurring pattern
Short checks shifting into social media
Small experiment
Before the next break, try 5 minutes offline

A single record is analyzed, but past records give it meaning.

The AI returns high drift, a possible study-break trigger, a recurring social-media pattern, and one small next-step experiment.

Why It Matters

Digital Compass turns awareness into a small next step.

- 1** Shows the difference between the user's intended use and actual behavior.
- 2** Makes repeated digital escape paths visible without shaming the user.
- 3** Uses generative AI to create cautious insight and one practical behavior experiment.

Digital Compass is not another screen-time tracker. It helps users understand when and why they lose their original direction.
